Customer advice, Method of work

Water Fed Pole Window Cleaning will soon be the industry standard for window cleaning at height. As a business wanting to be at the forefront of our industry, we have decided to invest in this technology which involves the use of telescopic poles and 100% pure water, which we filter through state of the art reverse-osmosis filters and de-ionisation vessels. We are embracing this technology for a number of reasons.

1. **Health and safety.** Legislation being brought into effect will limit the use of ladders as temporary workstations. The law as we understand it now states that ladders should only be used when all viable alternatives have been considered. As a company we have decided that water-fed pole systems are a safe viable alternative and are worth the investment. If the job can be completed to the same high standard without standing on a ladder, then we have no obligation to embrace this method.
2. **Better cleaning results.** Firstly, it cleans the windows and the frames. Second, the major advantage of pure water is its capacity to absorb large amounts of dirt from your windows. This process involves brushing and rinsing your windows clean with the pure water and allowing them to dry naturally to a streak free shine. This occurs due to the pure nature of the water used.
3. **Environmentally friendly.** Pure water only is used, eliminating the need for any detergents and chemicals, except where greasy dirt is a problem.
4. **Reduced disturbance and increased privacy.** No more dents in your lawn and unexpected appearances of faces at windows.
5. **We may now be able to reach previously inaccessible aspects of your property.** Conservatory roofs, windows above conservatories etc.
6. **Water-fed pole cleaning works in the rain!** Although we will not work in severe weather, showery misty weather will no longer hinder our work. This will help us to ensure a more regular and professional service to all our customers. Please note that it can take up to two or three visits for the process to 'leach' all deposits from around the frames, resulting in an improved finish each time. Therefore, please be patient if the initial visit is not perfect.
